Metadata

These reference tables contain statistics of the fertility rate in four countries in Asia since 1960. They are the countries that are estimated by the World Bank to have some of the highest fertility rates in the world in 2017. It also compares the data from the World Bank, and the United Nations World Population Prospects reports of 2017 and 2019. The fertility rate is the average number of children women have had or are likely to have in their lifetime. The graph besides each table shows the fertility rate of that year, and the absolute change over time. The x-axis is the absolute change while the y-axis is the total fertility rate. Each circle represents a certain year.

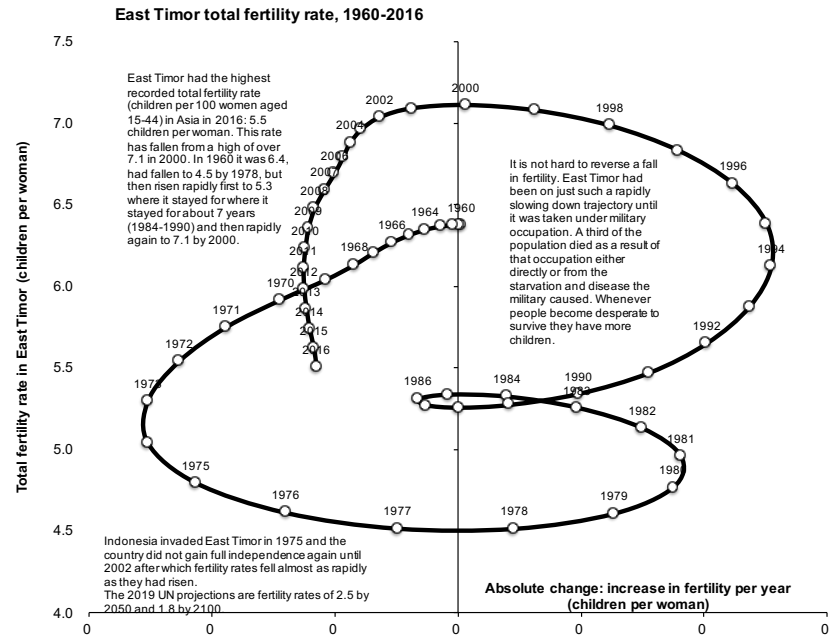

All four countries here have seen dramatic decline in fertility rate. Also, for all of them, the fertility rate is projected to fall to around 2.0 by 2095-2100 in the latest UN report.
