## Metadata

---

These reference tables contain statistics of voting results in several presidential elections in several regions in the UK. Here we compare the proportion in that region voting Conservative Party to that of national average. The graph besides each table shows the advantage of Conservative Party in that year in that region, and the absolute change over time. The x-axis is the absolute change while the y-axis is the advantage measured by percentage points. Each circle represents a certain election.

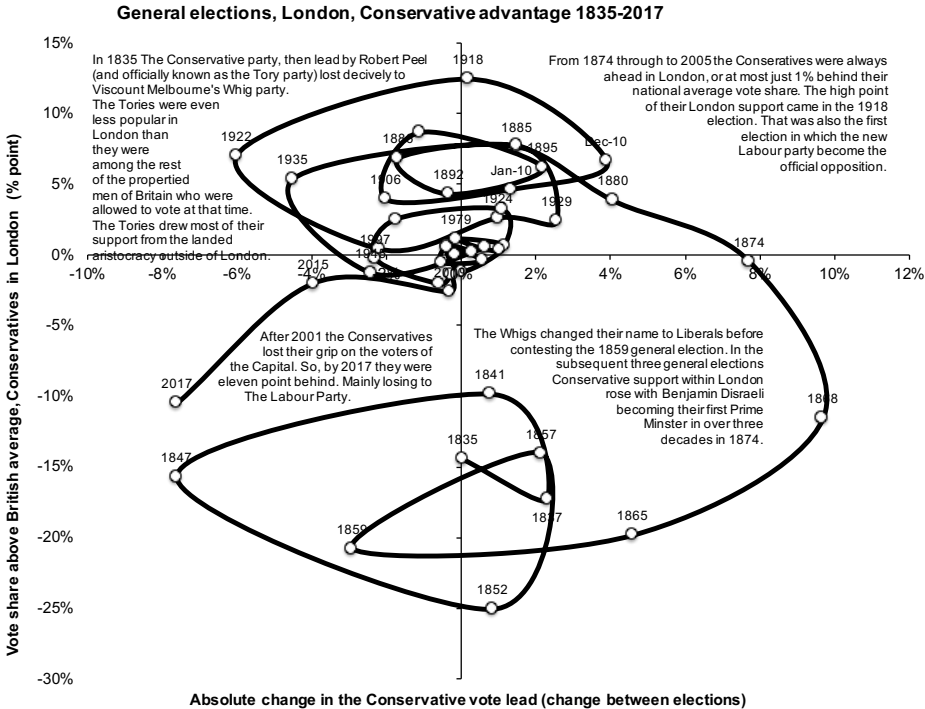

A clear south-north divide can be seen in the voting patterns.
