## Metadata

These reference tables contain statistics of my personal consumption on several drinks between 1995 and 2020 (I now have an aim for the consumption of those drinks). The graph beside each table shows the every consumption each year and the absolute change over time. The x-axis is the absolute change while the y-axis is the consumption. Each circle represents a certain year.

## Personal coffee consumption, 1995-2020

1. The Slowdown

The distance between the dots indicates the speed of change in either or both quantitiy and degree of growht. The gap betwe in 2011 and 2012 forexample, indicates that while there is barely any change in quantity of coffee I drank over the one year period, the rate of absolute change in my coffee consumption stagnated aftera relative fast three year retraction into negative growth, or slowdown. By 2015, the slowdown has continued at a slower rate

## Personal beer consumption, 1995-2020

 My beer consumption increased at an accelerating rate between1995 and 1999 when I was in my late 20 s and early 30 s. This 1995 and 1999 , when I was in my late 20 s and early 30 s . This
consumption changed very little in the first decade of 2000 . Then since 2013 , when I came back to Oxford, my beer consumption increased at an increasing speed. Two years later in 2015, I drunk one pint after work everyday and a bit more on weekends, and
that was quite enough for me. Since then, although I still drink a that was quite enough for me. Since then, although I still drink a
bit more beer than in previous years, the speed of the change has slowed down. 2020

## Personal water consumption, 1995-2020

As I drunk more and more cups of coffee, the amount of water I drink is declining for the past 20 years. The decline accelerated between 199. It the 1998 , when my coffee drinking increased with accelerated and 2002, the amount between 1999 and 2001. In years of 201 decline accelerated tof water drunk barely changed. Then the realise that I should still drink enoug. But since 2007, I began to coffee I have. should still drink enough water no matter how much coffee I have. Hence the speed of decline has dropped. I am now water per day next year

## Personal wine consumption, 1995-2020

My wine consumption increased with a slowdown between 1995 and 1999, when I was in my late 20 s and early 30 s . This consumption then increase at an accelerated rate in the first three yeas since 2000, and then slowed down again between 2003 and 2006. Throughout 2006 and 2012, very little increase occurred in my wine consumption. But things suddenly changed in 2013 , when I came back to Oxford. My wine consumption soared not only due to the formal dinners here but also due to the pre and after-drinks with almost every talk. Also the more talks I gave, the more wine I drunk
